How to Fork and Modify a Repository on GitHub

1 Navigate to https://github.com/blueskyDummy/4250_800

2 Click "Fork" to create a copy of the repository onto your GitHub account

3   Click "Create fork" to confirm

Create a new fork

A *fork* is a copy of a repository. Forking a repository allows you to freely experiment with changes without affecting the original project. View existing forks.

Required fields are marked with an asterisk (*).

Owner *   Repository name *

🔷 balawson ▾ /   4250_001

✅ 4250_001 is available.

By default, forks are named the same as their upstream repository. You can customize the name to distinguish it further.

Description (optional)

☑ Copy the `main` branch only

Contribute back to etsuDummy/4250_001 by adding your own branch. Learn more.

ⓘ You are creating a fork in your personal account.

Create fork

ⓘ   Once you have created the fork, you will be redirected to your copy of the repository

                                                                                               Publish your first package

5 Click the "edit" icon on the attendance file
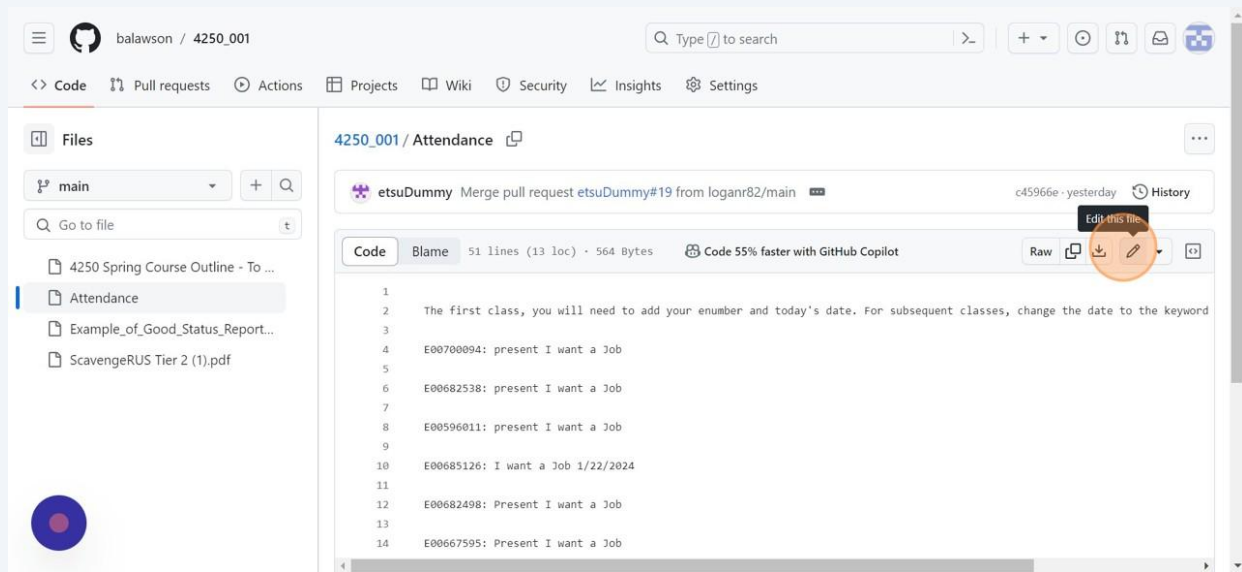

6 Enter your enumber and the phrase for the day
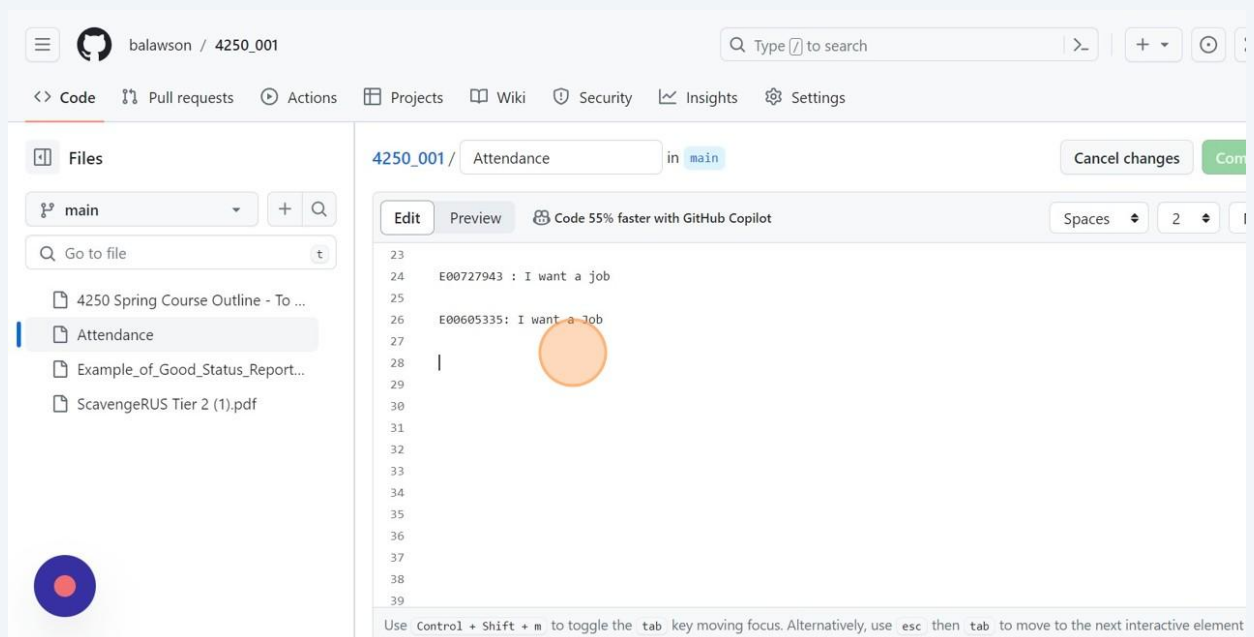

ℹ Once your enumber is in the file you will only have to edit the phrase for following days

7 Once you are done click "Commit changes..."
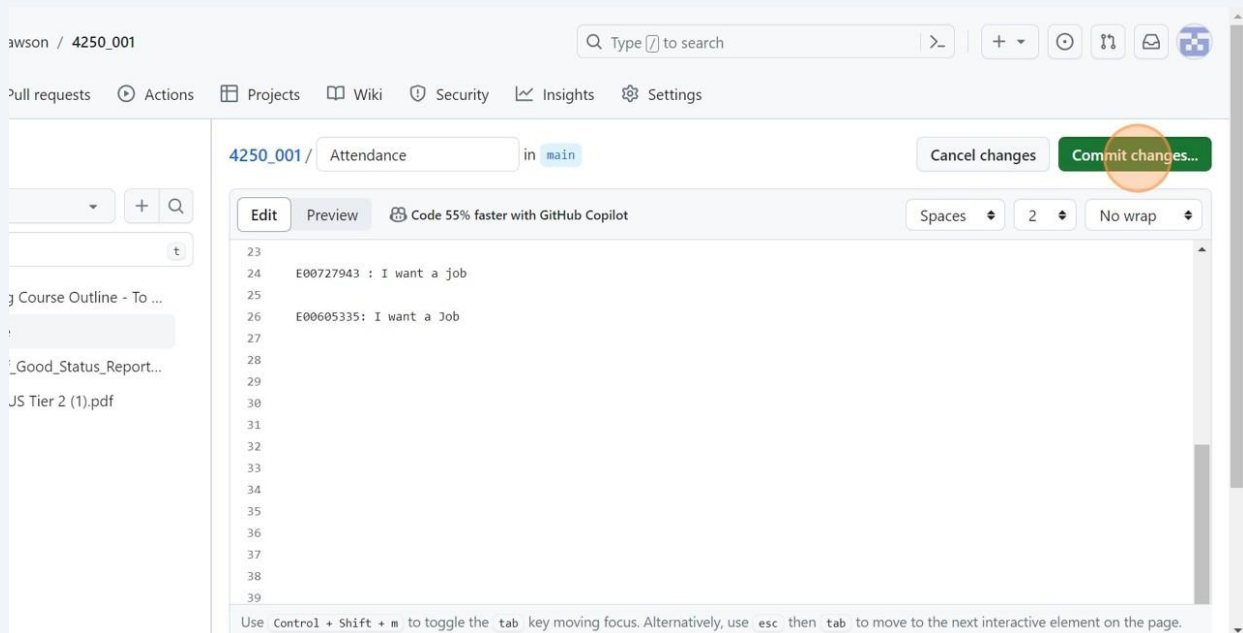

8 Click "Commit changes" again to confirm
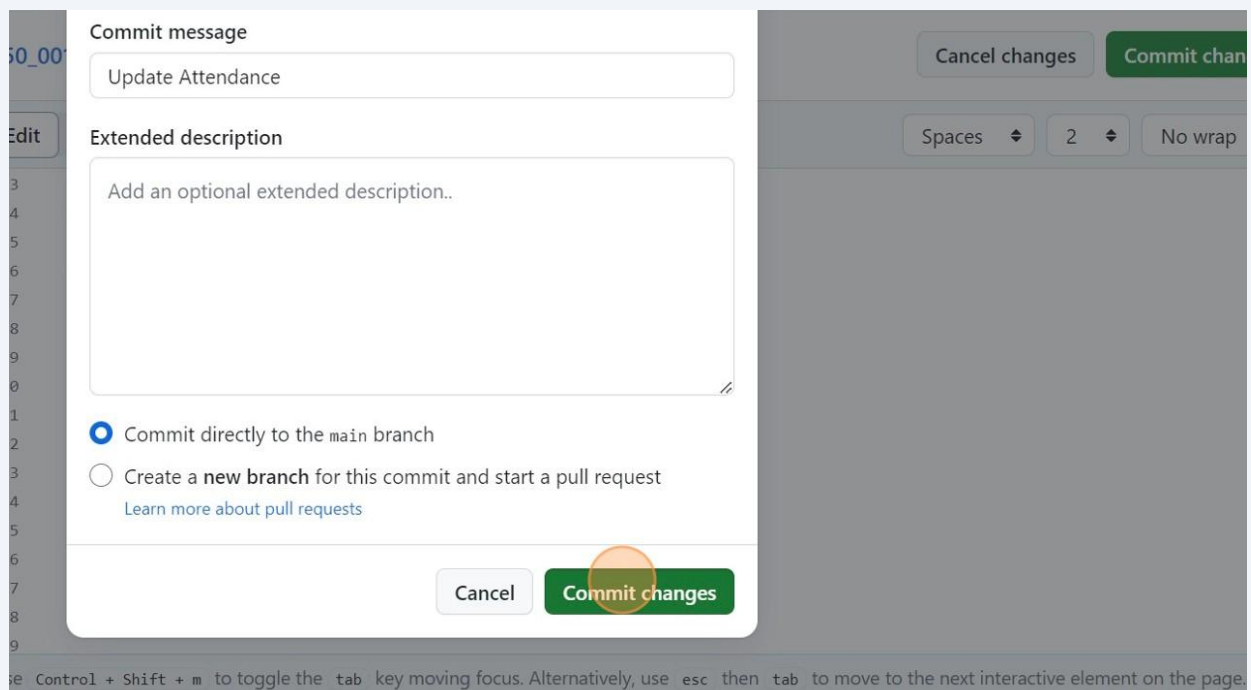

The changes here only affect your clone of the repository. Now we need to create a pull request to make those changes in etsuDummy

9 Go back to the "Code" section of your repository

10 Click "Contribute"

11 Click "Open pull request" in the drop down menu

12 Click "Create pull request"
